Genes were identified by a combination of three methods: Gene prediction programs including GRAIL (ftp://arthur.epm.ornl.gov/pub/xgrail), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://gnomic.stanford.edu/GENSCANW.html), and NetPlantGene (thtp://www.cbs.dtu.dk/services/NetGene2/), searches of the complete sequence against a peptide database and plant EST databases at TiGR, and manual curations based on those analyses. Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes Without significant peptide similarity but with EST similarity are named as 'unknown' proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NGAVVWNPWLGGGRWIQPSLNISPAWFDGIYVDNKKYKWAFSGLWKIYDFSEDVWID

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Genes without protein or EST similarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by two or more gene prediction programs over most of their length are annotated as 'nypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, thtp://genome.wastl.edu/eddy/tRNAscan-SE/). Simple repeats were identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RW/RepeatMasker.html). Genes are numbered from the top to bottom of the chromosome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  We thank the CSHL/WashU/ABI consortium for sequencing BAC clones F6P23 F5J6, and Till6, the ESSA group for sequencing clone F1D34, and Scott Jackson, Jiming Jiang, Klaus Meyer. Eric Richards and Satoshi Tabata for helpful assistance. In addition, we would like to thank the TIGR Bloinformatics Department, especially Lixin Zhou, Hanif Khalak, Michael E. Henney, Lilly Fu. Feng Liang, Jeremy Peterson, Michael Holmes, and Delwood Richardson for software and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /protein_id="AAC24186.1"

Medical Center Dr., Rockville, MD 20850, USA

On Dec 17, 1999 this sequence version replaced gi:3252804.

The sequence and annotation of chromosome 2 were merged from those of the individual clones on this chromosome after removing overlaps. For detailed information, please see the TIGR web site (http://www.tigr.org/tdb/at/at.html).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            predicted by genscan and genefinder"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This work was supported by the National Science Foundation, Department of Energy and the US Department of Agriculture.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Genes were identified by a combination of three methods: Gene prediction programs including GRAIL (available by anonymous ftp from arthur epm.orn.gov), Genefinder (Phil Green, University of Mashington), Genscan (Chris Burge, Mtp://gnomic.stanford.edu/-chris/GRNSCANW.html), and NetPlantGene (http://www.cbs.dtu.dk/netpgene-chbsnetpgene.html), searches of the complete sequence against a peptide database and the Arabidopsis EST database at TIGR (http://www.tigr.org/tb/ar/at.html).
Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named afatabase hits. Genes without significant peptide similarity but with EST similarity are named as 'unknown' proteins. Genes without proteins. Genes without proteins. Genes without proteins are named as 'unknown' proteins. Genes without proteins. Genes without proteins. Genes without proteins are named as 'nypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://ftp.genome.wusl.i.edu/eddy/tRNAscan-SE). Simple repeats are identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RW/RepeatMasker.html). Regions of exons by GRAIL are annotated as misc features.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /clone="F20H23"

                                                                                                                                                                                                                                                                                                                    The present sequence is a cDNA encoding corn adenylylsulphate kinase (APS kinase), also known as adenosine-5' phosphosulphate kinase. This is obtained from clone p0016.ctscj40rb, derived from corn pooled tassel shoots, p0016 cDNA library. APS kinase is a sulphate assimilation protein, that catalyses the conversion of adenosine-5' phosphosulphate (APS) to 3'-Phospho-adenosine-5' phosphosulphate (PAPS). This sequence is used as probe and primers to identify, obtain and synthesise sulphate assimilation proteins from other plants. It is also used to produce transgenic plants, that are useful for altering the expression levals of a sulphate assimilation protein. The APS kinase peptides are useful for producing antibodies, that are used to screen and isolate cDNA clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     100

                                                                                                                                           δ
                                                                                                                                                                                                The present sequence is a cDNA encoding corn adenylylsulphate kinase (APS kinase), also known as adenosine-5' phosphosulphate kinase. This is obtained from clone cen3n.pk0080.blo, derived from corn endosperm, cen3n cDNA library. APS kinase is a sulphate assimilation protein, that catalyses the conversion of adenosine-5' phosphosulphate (APS) to 3'-Phospho-adenosine-5' phosphosulphate (PAPS). This sequence is used as probes and primers to identify, obtain and synthesise sulphate assimilation proteins from other plants. It is also used to produce transgenic plants, that are useful for altering the expression levels of a sulphate assimilation protein. The APS kinase peptides are useful for producing antibodies, that are used to screen and isolate cDNA clones.

The present sequence is a cDNA encoding wheat adenylyIsulphate kinase (APS kinase), also known as adenosine-5' phosphosulphate kinase. This is obtained from clone wrl.pk0101.e2, derived from 7 day old light grown wheat root seedlings, wrl cDNA library. APS kinase is a sulphate assimilation protein, that catalyses the conversion of adenosine-5' phosphosulphate (APS) to 3'-Phospho-adenosine-5' phosphosulphate (APS). This sequence is used as a probe and primer to identify, obtain and synthesise sulphate assimilation proteins from other plants. It is also used to produce transgenic plants, that are useful for altering the expression levels of a sulphate assimilation protein. The APS kinase peptides are useful for producing antibodies, that are used to screen and isolate cDNA clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Adenylylsulphate kinase; Adenosine-5'phosphosulphate kinase; APS kinase; 3'-Phospho-adenosine-5'phosphosulphate; PAPS; sulphate assimilation; wheat; clone wrl.pk0101.e2; transgenic plant; screen; antibody; ss.

This is obtained from clone sdp2c.pk013.all, derived from soybean developing pods, sqp2c cDNA library. ARS kinase is a sulphate assimilation protein, that catalyses the conversion of adenosine-5' phosphosulphate (APS); to 3'-phospho-adenosine-5' phosphosulphate (APS). This sequence is used as a probe and primer to identify, obtain and synthesise sulphate assimilation proteins from other plants. It is also used to produce transgenic plants, that are useful for altering the expression levels of a sulphate assimilation protein. The APS kinase peptides are useful for producing antibodies, that are used to screen and isolate cDNA clones.

The invention relates to isolation of coding sequences and/or genes involved in tolerance to environmental stress in plants. The sequences (AAZ98105-298165) are useful for producing a transgenic plant having enhanced tolerance or resistance to environmental stress conditions as anaerobic, flooding, cold, dehydration, drought, heat stress or salinity. This is useful for producing improved yield, growth, development and productivity under environmental stress conditions, and also provides growth of crops in areas where they cannot grow without the induced osmotolerance. Sequences AAZ98305-365 represent
                               for producing transgenic plant by to environmental stress -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            289

The present invention relates to the isolation of human polynuclectide sequences that are differentially expressed during foam cell differentiation. The polynuclectide sequences of the invention or a composition comprising these polynuclectides are useful as a high throughput method for detecting altered expression of one or more polynuclectides in a sample. The polynuclectides can be used in the diagnosis of disorders associated with foam cell development such as atheroscierosis, cerebral stroke, and cardiovascular disorders such as coronary artery disease. The polynuclectide sequences can also be used useful in gane therapy. ASS9476-AASS9621 represent the human polynuclectide sequences of the invention are also polynuclectide sequences of the invention which are differentially expressed during foam cell differentiation.
                                                           Composition useful for diagnosis of conditions, disorders or diseases associated with atherosclerosis, comprises several polynucleotides that are differentially expressed in foam cell development -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               123
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              181
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              139

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 5474920
GENERAL INFORMATION:
APPLICATURE MOSES M.D., Robb E.
TITLE OF INVENTION: Modified Thermo-Resistant DNA:
TITLE OF INVENTION: Polymerases
INMARE NO SEQUENCES: 15
CORRESPONDENCE ADDRESS:
ADDRESSEE Allegretti & Witcoff
STREET: 10 South Wacker Drive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        COMPUTER: Apple Macintosh

of the primer [GAGAGAGAGAGAGAGACAACTACTCCAG(T)18V) to anchor the primer at the 5' end of the poly(A) tract.
After second-strand synthesis, the cDNA ends were filled in with cloned Ptu DNA, ligated to EcoRI adapters and subsequently phosphorylated. The CDNA was then precipitated and redissolved in sterile. RNASS., DNASS free water. The XhoI site within the first strand synthesis primer was then restricted by digestion with XhoI from Promega (400/ul); all XhoI sites in the CDNA would be protected by their hemimethylated status. The CDNA constructs were size-fractionated with 500Pp cutoff, using Sephacryl 5-500 High Resolution (Pharmacle Biotech) in a 2-mm diameter column and a bed volume of approximately lml. The column cluent was precipitated, redissolved, and ligated into Stratagene's pBluescript II XR Predigested weeter (pBluescript II SKH') wector that has been digested with EcoRI and XhoI, and phosphorylated by Stratagene). This library was constucted in the laboratory of Dr. Paul Kelm and Dr. Virginia H. Coryell at Northern Arizona University."

Xho1; The mRNA was isolated from roots of 8 day old
Baggd supernodulating mutent NTS382 seedlings that were
infected with Bradyhizolum japonicum, strain USDA 110, 72
hours prior to harvest. Dr. Gary Stacey generously donated
the tissue. The roots were flash-frozen in liquid
nitrogen. Stratagene's cDNA Synthesis Rit (catalog number
200401) was used to synthesize the cDNA. First-strand
synthesis was performed with 5-methyl dCTP, hence the
lighted cDNA was hemimethylated. A modification of
Stratagene's first-strand synthesis primer was used. An
'anchor' nucleotide (V=A, C, or G) was added to the 3' end
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Emall: est@watson.wustl.edu

"Ala_host="E. coli strain XLOLR"

/note="Vector: pBluescript SK-: Site_1: EcoRI; Site_2:
XhoI; cDNA was prepared from polyA+ enriched RNA from roots harvested at 10 days post inoculation with Phytophthora medicaginis. The cDNA was directionally ligated into the dni-ZAP XR vector from Stratagene and packaged using Gigapack III Gold packaging extracts.
Plasmids containing cDNA inserts were excised from the recombinant lambda-ZAP phage using RX-Assist helper phage and propagated in XLOLR cells. Note: EST may be of fungal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              // Anote—"Vector: lambda2AP; Site_1: BCORI; Site_2: Xhol; Seeds were surface sterilized then germinated under axenic conditions in the dark at room temperature on filter paper with water, mystatin and cefotaxime in covered crystallization dishes. Five-day old seedlings were incubated at 90% RH for 24 hr. Shocts were then harvested, total RNA was prepared, poly(A) RNA was purified, one primary unamplified cDNA library was made, 600000 pfu were in vivo excised to give palluescript SK(-) CDNA phagemids. These steps were performed in the TJ Close laboratory at the University of California, Riverside (Choi, Close, Fenton). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Arkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Sector).

The library was prepared using the Life Technologies psuperScript cDNA library construction kit. Complementary DNA was synthesized from manA using a poly(dT) sequence with a Nott restriction site. Sall linkers adapters were ligated to the blunt-ended cDNA fragments followed by NotI digestion. The CDNA fragments were directionally cloned into the NotL-Sall restriction site of the pSPORTI vector. The ligated cDNA fragments were transformed into E. coli ElectroMax DH10B host cells. This library was constructed by Dr. Lila voddkin and Dr. Anu Khanna. Note that Gm-1300 is a re-rack of Gm-cl007."

ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRT. And Independents were directionally cloned into the EcoRT. The ligated cDNA fragments were transformed into the Boost cells (GibcoBRL). The library was constructed in cooperation with Dr. Paul Kelm's laboratory at Northern Arizona University."

The CSTA libraries will attempt to capture the induction and initiation/initial growth of the tuber in an in vitro system as described in Bachem et al. (Plant Journal, 1996). Small microtubers develop from axillary buds attached to stem explants when placed on a high sucrose medium (10%). Visible morphological changes occur synchronously at day five in the axillary buds. The first library, CSTA (1-20) consists of axillary buds harvested on days 1-3. This targets those genes involved in induction of the microtubers. The following libraries, CSTA (21-40) and CSTA (41-60), capture genes involved in tuber initiation and outgrowth. This library is noted as P3 in Tanksley lab notebooks."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       517

mid-log phase in TAP (acetate-containing) medium in the
mid-log phase in TAP (acetate-containing) medium in the
light, TAP medium in the dark, HS (minimal) medium in
amblent levels of CO2 and HS medium bubbled with 5% CO2.
POLYA mRNA was purified from each sample, pooled and cDNA
synthesized. The cDNA was directionally cloned into lambda
ZAP II (Stratagene) in the EcoRI (5') and XhOI (3') sites.
pBluescript II SK- plasmids were excised from the lambda
ZAP clones by superinfection with ExAssist (Stratagene)
phage. The library was normalized using method 4 described
in Bonaldo et al (1996) Genome Research 6: 791-806."
